## Experiment- 2.2

**Student Name:** UTKARSH JOSHI

**UID:** 21BCS9158

**Branch:** BE-CSE

**Section/Group:** ST-802-A

**Semester:** 5<sup>th</sup>

**Date of Performance:** 27-09-23

**Subject Name:** Advanced Programming Lab

**Subject Code:** 21CSP-314

**Aim:** To implement the concept of Tree data structure.

### **Objective:**

1. Given a pointer to the root of a binary tree, print the top view of the binary tree. The tree as seen from the top the nodes, is called the top view of the tree.
2. You are given a pointer to the root of a binary search tree and values to be inserted into the tree. Insert the values into their appropriate position in the binary search tree and return the root of the updated binary tree. You just have to complete the function.

### **Program Code:**

1.

```
#include<bits/stdc++.h>
using namespace std; class
Node { public:
    int data;
    Node *left; Node
    *right;
    Node(int d) { data =
        d; left = NULL;
        right = NULL;
```

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
    } }; class
```

```
Solution {  
    public:
```

```
        Node* insert(Node* root, int data) { if(root  
            == NULL) { return new  
                Node(data);  
            } else {  
                Node* cur; if(data <= root->  
                    >data) { cur = insert(root->left,  
                        data); root->  
                            >left = cur;  
                } else { cur = insert(root->right,  
                    data); root->right = cur;  
            } return root;  
        }  
    } class
```

```
Node { public:
```

```
    int data;  
    Node *left;  
    Node *right;  
    Node(int d) { data =  
        d; left = NULL;  
        right = NULL;  
    }
```

```
};
```

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
void topView(Node * root) { queue<pair<int,Node*>> q;
    q.push(make_pair(0,root)); map<int,Node*> ans;
    for(auto i=q.front();!q.empty();q.pop(),i=q.front()){
        if(!i.second) continue; ans.insert(i);
        q.push(make_pair(i.first+1,i.second->right));
        q.push(make_pair(i.first-1,i.second->left)); }
    for(auto i:ans) cout<<i.second->data<<" ";
} }; int
main() {
    Solution myTree; Node*
    root = NULL;

    int t;
    int data; std::cin >> t; while(t-- > 0) {
        std::cin >> data; root =
        myTree.insert(root, data);
    }

    myTree.topView(root);    return 0;
}
```

**Output:**

✓ Test case 0

✓ Test case 1

✓ Test case 2

✓ Test case 3

✓ Test case 4

✓ Test case 5

Compiler Message

Success

Input (stdin)

## Program Code:

2.

```
#include <bits/stdc++.h>
using namespace std; class
Node { public: int data;
Node *left;
Node *right;
Node(int d) { data =
d; left = NULL;
right = NULL;
} }; class
Solution {
public:
void preOrder(Node *root) {
if( root == NULL )
```

```
        return; std::cout << root->data << " ";
        preOrder(root->left); preOrder(root->right);
    }
    Node * insert(Node * root, int value) {
    if(root==NULL) {

        Node* newNode; newNode =
        (Node*)malloc(sizeof(Node)); newNode->left =
        NULL; newNode->right = NULL; newNode-
        >data = value; return newNode;
    } if(value <= root->data) root->left =
        insert(root->left, value); else root-
        >right = insert(root->right, value);
    return root;
} }; int
main() {
    Solution myTree; Node*
    root = NULL;
    int t; int data; std::cin
    >> t; while(t-- > 0) {
        std::cin >> data; root =
        myTree.insert(root, data); }
    myTree.preOrder(root); return
    0;
}
```

# **DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING**

Discover. Learn. Empower.

## **Learning Outcomes:**

1. Learnt about Trees data structure and how to implement it.
2. Learnt about binary trees and how to insert it.
3. Learnt about Tree traversal techniques.

### Experiment- 2.3

**Student Name:** UTKARSH JOSHI

**UID:** 21BCS9158

**Branch:** BE-CSE

**Section/Group:** ST-802-A

**Semester:** 5th

**Date of Performance:** 27/9/23

**Subject Name:** Advanced Programming Lab

**Subject Code:** 21CSP-314

#### **Program 1:**

**Aim:** Determine whether a given numeric string can be split into a beautiful sequence of positive integers, adhering to specific conditions, and to find the smallest starting number if it is beautiful.

**Objective:** The objective of this experiment is to develop a program that assesses whether a given numeric string meets the criteria for being a "beautiful" sequence and, if so, identifies the smallest starting number of the sequence.

#### **Program 2:**

**Aim:** A *pangram* is a string that contains every letter of the alphabet. Given a sentence determine whether it is a pangram in the English alphabet. Ignore case. Return either pangram or not pangram as appropriate.

**Objective:** To determine whether a given sentence is a pangram, you can create a function in Python that checks if all 26 letters of the English alphabet (ignoring case) are present in the input string. You can use a set to keep track of the letters you've seen in the string and compare it to a set of all 26 English alphabet letters.

#### **Code and Output:**

#### **Program 1:**

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
#include <bits/stdc++.h>
```

```
using namespace std; bool isBeautiful(string s, long long  
first_num) {    long long current_num = first_num;  
string beautiful_sequence = to_string(current_num);
```

```
while (beautiful_sequence.length() < s.length()) {  
current_num++; beautiful_sequence +=  
to_string(current_num);  
}
```

```
return beautiful_sequence == s;  
}
```

```
void separateNumbers(string s) { for (int len =  
1; len <= s.length() / 2; len++) {    long long  
first_num = stoll(s.substr(0, len));    if  
(isBeautiful(s, first_num)) {        cout <<  
"YES " << first_num << endl;    return;  
    }  
}
```

```
cout << "NO" << endl;  
}
```

```
int main(){  
int q;    cin  
>> q;
```

```
    while (q--){        string  
s; cin >> s;  
separateNumbers(s);  
    }    return  
0;  
}
```

## Output:

✓ Test case 2

✓ Test case 3

✓ Test case 4

✓ Test case 5

✓ Test case 6

✓ Test case 7

✓ Test case 8

## Program 2 :

```
#include <bits/stdc++.h>
using namespace std;

string check_string(string s){

    set<char> letters;
```

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
    for (char c : s) {  
        if (isalpha(c)) {  
            letters.insert(tolower(c));  
        }  
    }  
  
    if (letters.size() == 26) {  
        return "pangram";  
    }  
  
    else {  
        return "not pangram";  
    }  
}  
  
int main() {  
    string s;    getline(cin, s);  
    string result = check_string(s);  
    cout << result << endl;  
  
    return 0; }
```

**Output:**

# DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

A screenshot of a HackerRank test case interface. On the left, a sidebar lists six test cases, all marked as 'Test case 0' through 'Test case 5' with green checkmarks. The main area displays the results for 'Test case 0'. It shows a 'Compiler Message' of 'Success'. Below that, the 'Input (stdin)' is shown as 'We promptly judged antique ivory buckles for the next prize', with a 'Download' link. The 'Expected Output' is shown as 'pangram', also with a 'Download' link.

## Learning And Outcomes:

- Learned the implementation of String in Hacker Rank.
- Learned about pangrams and how to determine a pangram.
